Problem domain

In this day and age, more and more green trends are emerging and being implemented in various settings (Akepa, 2025). These ideas are about pushing through the usual conventions by actively pursuing a sustainable lifestyle. Bob, the coordinator of Cloverville - a self-sustaining community - is trying to follow such ideas by implementing a new system in his community.

Bob is living in a village of 42 people - Cloverville, which is a self-sustaining community where green energy is prioritised and eco-friendly actions are encouraged -*"we're a green community that values sustainability and ecology."*, however he is using an inefficient notebook system where he notes the "invisible work" sustaining the village and therefore wants to create & upgrade his point system where he can record activities and see who contributes-*"green initiatives are flowing...I want to document it, and my worn out notebook is no longer enough."*

He wants to promote green activity by implementing a 2 point system which consists of **communal points** ("green points" - 'climate capital') earned through green actions as cycling to work for a whole week, eating vegan for a week, switching to energy efficient lighting, and so on. And a second type of points, **personal points** ("Individual Points"), that can be obtained through communal and tasks and trade offers (shared tasks and trade tasks - preparing food for communal dinners, tidying the workshop, taking care of the shared outdoor areas, or garden duties)-*"we're talking about registering three types of activities, two types of points, reports showing inspirational actions, and reports showing available trade tasks."*

These points are meant to motivate the villagers to contribute to the commune, moreover the village has a catalogue of ideas meant to promote green activities in the village-"they're more for inspiration". Also the commune green point can be used for trade offers and tasks. Also in order to keep things equal Bob wants the personal points to be reset periodically and to flow in the community pool if unused and for the people who rarely participate to give a bonus. And when some thresholds are reached they can unlock different community projects like building a rainwater collector, hosting a pizza night, buying a new communal wheelbarrow.

Problem statement

How can a coordinator sustain an eco-friendly village and motivate the population to participate in green activities/shared tasks, and how can it be administered?

- How will the system encourage green actions and collaboration among the villagers?
- What method can be used to keep everyone's status equal?
- What is “periodically” in regard to the resetting of points?
- How can villagers benefit from the invention and collaboration of doing green actions/shared tasks?
- How to inspire other villages with what information?
- How many points should different types of activities earn?
- How often should the individual points be reset, and how can it be scheduled/performed?
- How can the coordinators monitor the green actions/shared tasks?

Delimitations:

Conversion to real money with the upgrades

Choice of methods

- **Organizing:**
  We're going to plan meetings with the group where we are gonna discuss the steps we need to take in order to successfully build the system wanted by the client. We're gonna split the work into steps and assign equal work to everyone in order to be as efficient as possible.During the meetings we are going to discuss the progress since the last meeting and what difficulties we encountered.
- **Analytical assessment**
  We're going to assess how our previous steps toward finalising the project worked and plan the next small approaches we are going to try to implement while noting the changes (cohesion, readability, efficiency, accessibility).
- **Research**
  We are going to have in detail meetings with the coordinator to go more in depth with specific details and get feedback on the work we have till that point.
- **Design/construction and testing.**
  We are going to put together all our work and make sure it functions harmonically. We are going to do a simulation of a virtual village to make sure all the functionalities of our system work flawlessly.

Time schedule

deadline: December 19th. 13:00

Total hours/expected workload: since our group consists of 4 members we expect our workload to be 1100 hours per ETCS per person.

Till 31 of November do a group meeting each wednesday for 6 hours.
From 1 December meet each working day for 7.5h.

Defined milestones/achievements:

1.Milestone - Understand coordinator needs and splitting the tasks
2.Milestone - Meeting with Bob and defining his needs
3.Milestone - Create a basic design and users roles
4.Milestone - Create the basic functionalities
5.Milestone - Connecting the web interface with the application
6.Milestone - Getting Bob's input on our work so far
7.Milestone - Finalising everything and making sure all works flawlessly

Risk Assessment

Risks	Likelihood Scale: 1-10 10=high risk	Severity Scale: 1-10 10=high risk	Product of likelihood and severity	Risk mitigation e.g. Preventive - & Responsive actions	Identifiers	Responsible
	2	6	12	Reading the case again and clarifying it with the supervisors	getting negative feedback from teachers	Iulian
Uneven workload	3	8	24	Split the work at the start of the meeting	Complaint from one of the team members, tension between members	Everyone
Loss of files/code	2	7	14	version control (github)	no code, error messages, missing files	Bátor
Low motivation	4	5	20	Doing an activity together that is not related to the project(drinking)	lack of effort put into project work	Arsenie
Falling behind schedule	2	4	8	Allocating more time to the SEP project	Lack of communication/stuck on certain parts of the project.	Mike
Inconsistent meetings/bad communication	2	5	10	meeting with the supervisor.	mentality in bad state/low motivation.	Everyone
